Our purpose is to source, mine and trade minerals in a sustainable manner for the EU industries. It is our approach to cooperate with companies who are interested in generating reliability and value in the clean minerals business with Africa, thus fostering new patterns of raw materials’ supplies and availability.

By directly involving our customers in the value chain, we guarantee long-term reliable and competitive off-taker agreements.

We offer solutions to diversify the supply of clean minerals to Europe from both primary and secondary resources and to enhance resource efficiency.

We are members of ERMA (European Raw Materials Alliance) and EBA (European Battery Alliance).

The minerals that we mine ourselves are

**Cobalt** - a mineral that is mainly used in lithium-ion batteries and in manufacturing magnetic, wear resistant alloys.

**Graphite** - a good conductor of heat and electricity for use mainly in products such as electrodes, batteries and solar panels.

**Lithium** - an anode material mainly used in batteries.

**Manganese** - used in alloys such as steel.

**Vanadium** - a mineral which is mainly used to increase the strength and the corrosion resistance of steel and other metals.

**Soda Ash** - with the chemical industry as a major beneficiary, but also for smelting aluminum products and other metals.

Additionally, we are able to source Copper, Nickel and Rear Earths.

We supply these minerals on a reliable long-term basis. We give our customers comfort that the source of the products can be identified with certainty and that prices are highly competitive.

We further coordinate any logistics that may be required.
